

## 66 LEU 9AC Control phone

Paster diagram for a telephone 66LEU9AC made by STC for the Irish P&T for use with the STC railway despatching system which used the type 60 selector.

It is based on the 746. The printed circuit board for the standard 746 remains in situ but the tracks have been severed and the terminals are used only as a connection strip. A new set of HS springs has been fitted to the gantry. Two transformers and some other components have been fitted to the base and as there is no bell there is a lot of space available.

John Mulrane
