

Automatic operation

Incoming calls

These can be answered simply by lifting the receiver at any one of the extensions specially designated to receive calls. A call can be transferred quickly to any other extension. If necessary the call can be transferred more than once. A call for an engaged extension can be held by the equipment until it is available then it rings through automatically. To warn of urgent calls, a 'ticking' tone can be given to an engaged extension. Exchange lines can be held while making an internal enquiry to another extension - and this cannot be overheard by the caller.

Should you want incoming calls normally to be handled by one person a special 'attendant's' telephone can be fitted which combines the facilities of two designated extensions, operation is still very simple.

Outgoing calls

These can be made from any extension telephone. If you wish, special arrangements can be made to prevent specified extensions from making outgoing calls.

Night service

The exchange stays on duty 24 hours a day and can be adapted specially for the use of night staff. A night service button on one of the designated extensions alters the facilities available. A limited number of extensions with restricted calling arrangements during the day can be made to have full facilities at night.

Ask telephone sales

Now ask your secretary to make a call to your Telephone Sales Office - the number is in the directory. Have a word with your Post Office representative. He is ready to advise and show you exactly how an unattended PABX could fit in with your particular needs.

Private Automatic Branch
Exchange

Your private self-operating telephone exchange

Automatically fast and efficient communications promote business and save money.

All your telephoning at any time of the day or night becomes so simple that you take the system for granted.

You gain . . .

The concept of automated communications for the telephone user is superbly realised in the smallest unattended telephone exchange of its kind available. There is no switchboard; extension users deal with incoming calls. External and internal calls can be dialled directly from up to 20 extensions.

This version of PABX (Private Automatic Branch Exchange), as it is known, is especially suitable for installations where a new organisation is being planned or a smaller manually operated exchange is being replaced. Provided for the small-to-medium-sized company, it improves communications in offices, works and warehouses. The facilities required at the outset can be expanded as your requirements grow up to 5 exchange lines and 20 extensions.

A nationwide maintenance service ensures that your equipment will be kept working efficiently. Incidentally, if there is a power failure, the exchange lines are switched to predetermined extensions which then have the same facilities as direct exchange lines.

You save . . .

No switchboard means no full-time operator – you save the problems of relief operators for breaks, holidays and illnesses.

No separate internal system is needed and one phone per desk deals with both external and internal calls.

The automatic exchange unit is compact, unobtrusive and easy to accommodate. For power, the customer provides only one 3-pin mains socket of at least 5 amps.

Capital outlay is limited to an initial charge when the PABX is connected or enlarged. Rental contracts are for as little as one year, and these cover maintenance by Post Office engineers.
